

Chemistry Services for Drug Discovery

A young boy with dark skin and short hair is smiling, wearing a white lab coat, a red bow tie, and large clear safety goggles. He has his arms crossed. The background is a chalkboard with faint, light-colored drawings of chemistry glassware (flasks, beakers, test tubes) and a molecular structure.

New Product Highlights 2020-2021

Designed for Medicinal Chemistry Research

Dear Colleague,

Welcome to our new catalogue for medicinal chemistry containing a selection of compounds chosen to highlight the variety of structures available in our collection.

With a catalogue of over 90,000 compounds, we have plenty to choose from however we have decided to highlight our most interesting and diverse products within eight categories: Amino acids, Boronic acids, PEG linkers, Fluorinated compounds, Bicyclic compounds, Spiro compounds, Alkynes and Azides. In addition to demonstrating our latest additions to our established areas such as novel scaffolds and heterocycle, this catalogue also features some of our most exciting compounds in newer areas for Activate Scientific such as PEG linkers, Alkynes and Azides.

The compounds are arranged for ease of browsing into structural categories. The availability of regio-isomers within related compounds allows swift access to SAR and the inclusion of heteroatoms aids the modification of physiochemical properties and enables the probing of binding sites. The incorporation of functional groups such as boronic acids, carboxylic acids, aldehydes, amines and alcohols enables expedient synthetic strategies.

Our compounds are available in stock for express delivery at competitive prices. Custom synthesis of proprietary scaffolds and bulk quotations are available on request.

On the inside of the back cover, you will find a demonstration of our search tools to help you explore our full range of over 90,000 products and provide inspiration for future research.

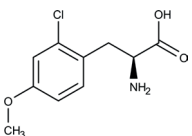

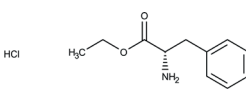

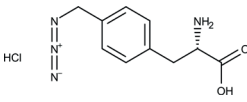

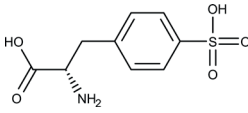

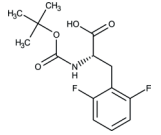

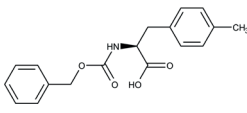

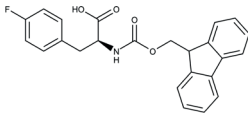

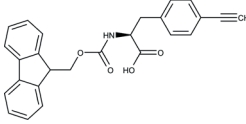

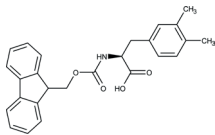

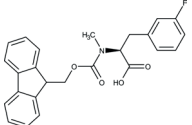

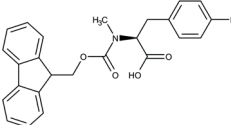

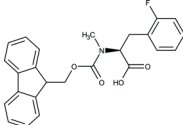

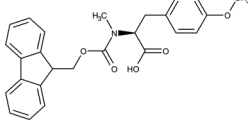

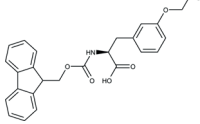

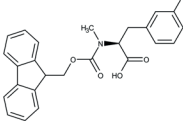

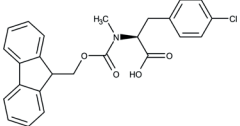

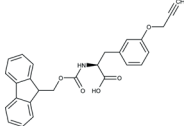

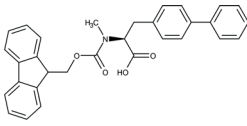

The complete collection can be found and searched on our website:

PEG linkers.....	23
Bicyclic Rings.....	27
Spiro Compounds	36
Fluorinated Compounds	45
Alkynes	57
Azides	59

Amino Acids

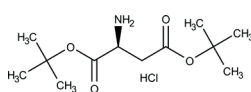

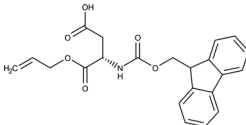

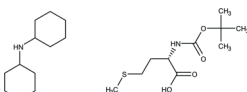

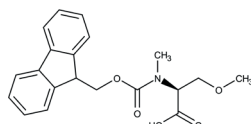

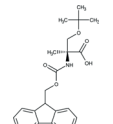

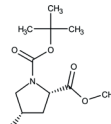

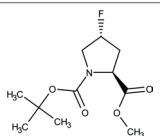

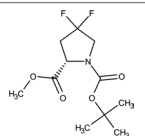

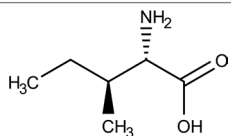

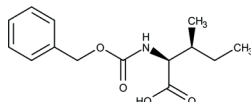

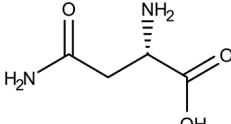

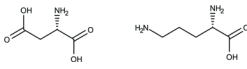

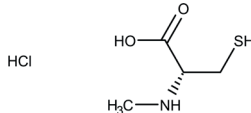

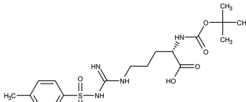

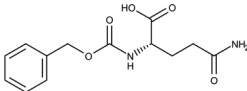

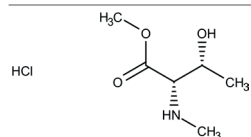

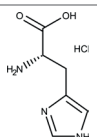

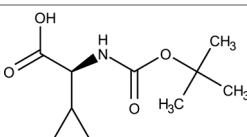

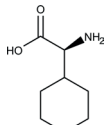

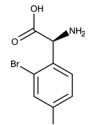

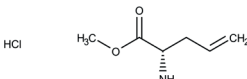

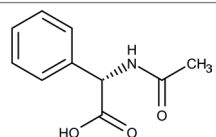

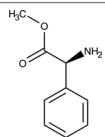

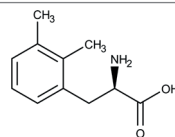

We have significantly expanded our collection of amino acids which are important tools in drug discovery. We offer a wide range of both proteinogenic and unnatural amino acids. Our diverse range of amino acids contains a variety of synthetically tractable functional groups enabling expedient synthetic strategies including protected amino acids for solid-phase peptide synthesis. Our unnatural amino acids exploit the defined stereochemistry and the amino/carboxylic acid functionalisation of a natural amino acid whilst incorporating one or two sidechains and allowing for a wide degree of functionalisation. Due to these properties unnatural amino acids are excellent starting points for complex synthesis, highly useful for SAR investigations and the incorporation into peptidomimetic drugs all make them highly valuable in medicinal chemistry. Please examine a sample of our Amino acids.

Boronic Acids

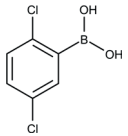

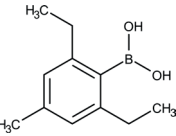

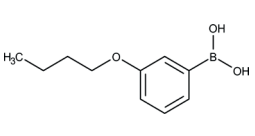

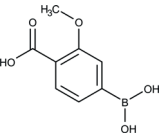

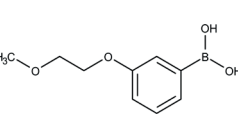

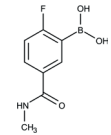

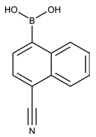

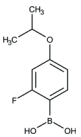

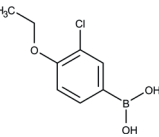

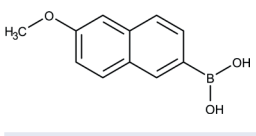

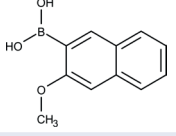

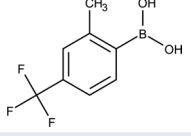

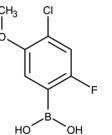

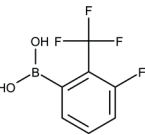

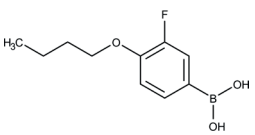

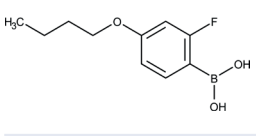

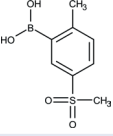

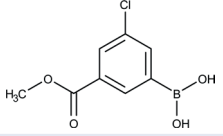

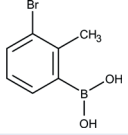

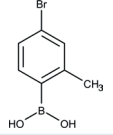

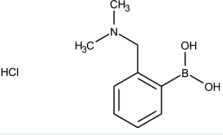

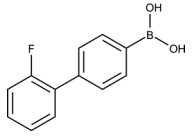

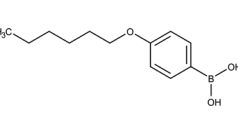

Boronic acids are one of our most popular functional groups and we are constantly increasing our range and variety of boronic acids. Organoboronic acids and esters are well established for general Suzuki C-C bond coupling reactions. Our extensive experience in directed metallation chemistry, classical metal-halogen exchange and Pd catalysed coupling of organohalides with bis(pinacolato)diboron enables us to synthesize complex boronic acids even in the presence of sensitive functional groups. These are versatile reagents to allow the rapid exploration of chemical space making them ideal for early hit identification, fragment-based approaches, hit-to-lead programmes, lead optimisation and library production. The incorporation of synthetically tractable functional groups such as amine, carboxylic acid, ketone, and hydroxyl enables expedient synthetic strategies. Please examine a sample of our Boronic acids.

PEG Linkers

PEG Linkers are highly attractive as linker molecules due to their low immunogenicity, lack of toxicity and water solubility. They are commonly attached to peptides, antibody fragments and proteins altering the physiochemical properties. PEGylation can also give several pharmacological advantages including; increased solubility, increased stability, reduced dosage frequency and extended circulated life. This has led to a wide variety of PEGylated pharmaceuticals across a range of therapeutic areas: Plegridy US7588755B1 (Biogen) for treatment of multiple sclerosis, Pegvaliase US20190376081 (BioMarin) for treatment of genetic disease phenylketonuria, Peginesatide US7084245B2 (Affymax) for treatment of anaemia associated with chronic kidney disease. PEGylation also has biotech uses for cell transfection and gene editing in non-human cells. The incorporation of synthetically tractable functional groups such as amine, carboxylic acid, ketone, boronic ester and hydroxyl enables expedient synthetic strategies. Please examine a sample of our PEG Linkers.

Bicyclic Rings

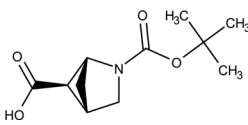

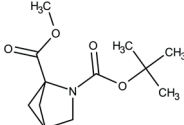

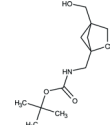

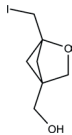

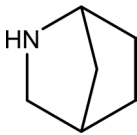

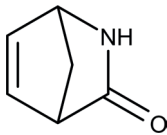

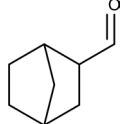

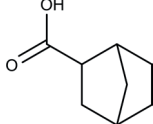

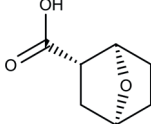

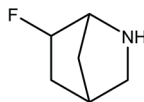

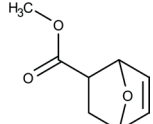

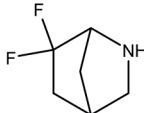

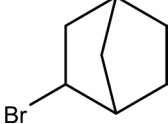

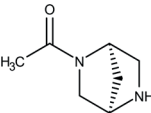

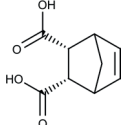

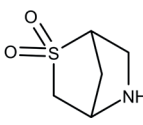

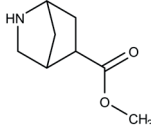

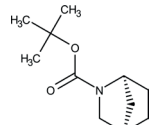

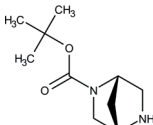

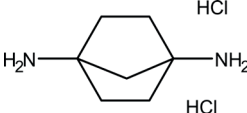

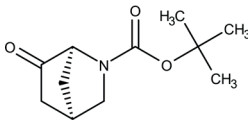

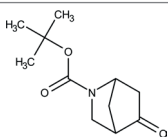

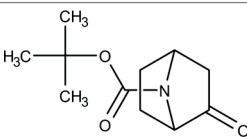

We have considerably expanded our catalogue of bicyclic compounds. We have compiled this selection from our extensive catalogue which contains structural features found in drug molecules in many therapeutic areas: Bicyclo [3.2.1] compounds are SGLT2 inhibitors for the treatment of type 2 diabetes – ZA201203486 (Pfizer); bicyclo [3.1.0] compounds are GlyT1 inhibitors for the treatment of neurological/psychiatric disorders – WO2013017657 (Boehringer Ingelheim); bicyclo [3.1.0] compounds are mGlu2 agonists for bipolar and generalised anxiety disorder – WO2012173850 (Lilly); bicyclo [2.2.1] compounds are Cathepsin C inhibitors for the treatment of respiratory diseases – TN2015000381; bicyclo [3.3.0] compounds are orexin receptor antagonists – ZA201001434 (Actelion). Please examine a sample of our wide range of bicyclic compounds.

Spiro Compounds

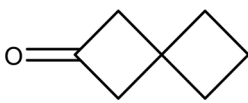

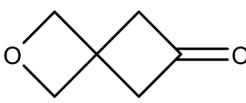

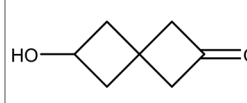

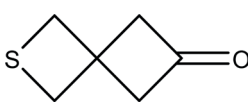

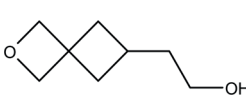

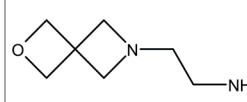

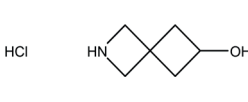

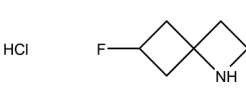

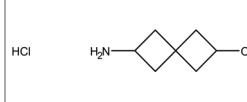

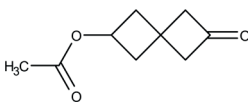

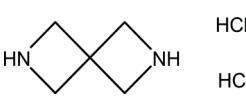

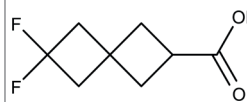

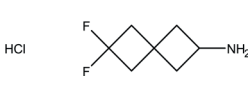

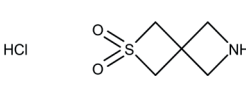

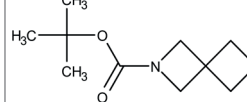

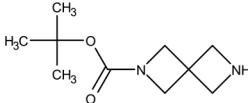

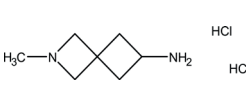

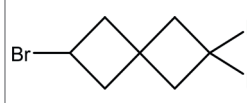

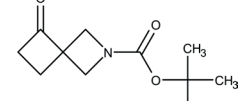

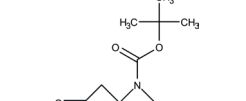

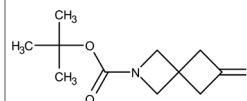

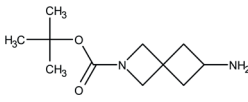

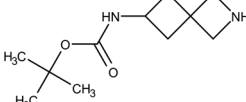

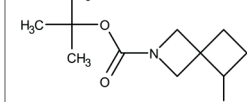

We have considerably expanded our catalogue of Spirocyclic compounds. Spirocyclic molecules are of high interest in medicinal chemistry due to their three-dimensional structure and ability to project functionality in all directions allowing binding to many three dimensional sites. Further advantages of spirocycles are water solubility, log P values, and metabolic stability, with the sp³ character of spirocycles allowing increased solubility compared to aromatic and heterocyclic rings. Spiro compounds are common as drug molecules in various therapeutic areas: Voltage-gated sodium channel modulators as local anaesthetics or for the treatment of bipolar disorders or depression – WO2013093497 (Convergence Pharmaceuticals); NK1 antagonists for the treatment of Schizophrenia, emesis and depression – WO2005097795 (Janssen Pharmaceuticals), WO2009133135 (GlaxoWellcome). The quaternary carbon and the potential of multiple stereocentres have made spirocycles difficult to synthesise resulting in this being an area that is yet to be fully explored for medicinal chemistry. Please examine a sample of our wide range of spirocyclic compounds.

Fluorinated Compounds

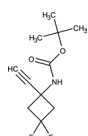

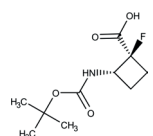

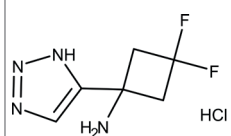

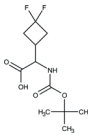

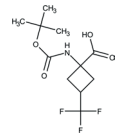

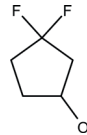

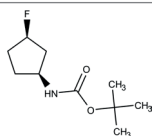

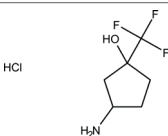

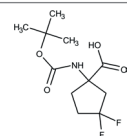

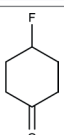

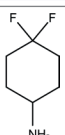

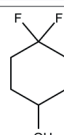

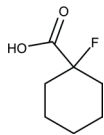

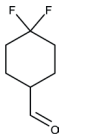

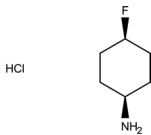

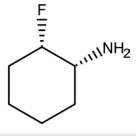

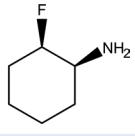

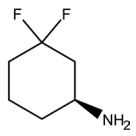

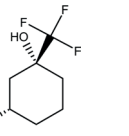

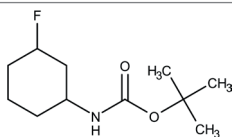

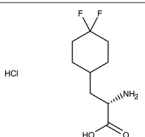

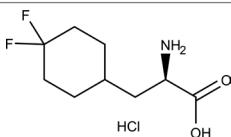

The use of fluorine in medicinal chemistry is well documented, particularly in influencing the metabolic stability and physicochemical properties of compounds. Most studies focus on lowering the pKa values on the basic nitrogen in heterocycles this can reduce the likelihood of blockage of the hERG channel responsible for cardiac arrhythmias. Fluorinated piperidines and pyrrolidines are common in drug molecules: serotonin and norepinephrine re-uptake inhibitors for pain disorders –WO2013030185 (Theravance); EP2 antagonists for the treatment of endometriosis –WO2010052625 (Pfizer); ORL-1 receptor antagonists for the treatment of alcohol dependence and abuse –WO2013085781 (Eli Lilly); 5-HT2B receptor antagonists for the treatment of pulmonary hypertension and cardiovascular disorders –US2014187585 (Janssen). Further studies are looking into fluorinated cycloalkyls as alternatives. Fluorinated functionalisation and sp³-hybridised carbon atoms are two of the most exciting areas in medicinal chemistry today. Research has shown that three-dimensional ring structures such as cyclopropane and cyclobutane offer the possibility of increased solubility and the opportunity of accessing biological targets with more globular shapes. Furthermore, with a proven track record of successful progression in clinical testing, demonstrated by the leukotriene C4 synthase inhibitors - WO2016177845 (AstraZeneca) and the orexin receptor antagonists - US20120095031 (Elsai) fluorinated cycloalkyls can be a very powerful tool for drug discovery. Please examine a selection of fluorinated compounds.

Alkynes

One of the most exciting additions to our catalogue is a broad range of Alkynes. Alkynes are a structural feature present across a wide range of therapeutic areas including the antiretroviral Efavirenz –US91018192B2 (Gilead) for the treatment of HIV infection and the antifungal Terbinafinen WO2010086723A1 (Galderma). Alkynes are also found in anti-tumor drugs, with molecules containing the ene-diyne structure acting as highly aggressive antitumor drugs generating radical intermediates that attack the DNA of the tumour. Alkynes are a structural feature used in drug discovery for its participation in the Huisgen azide-alkyne 1,3-dipolar cycloaddition reaction, an example of 'click chemistry'. As well as being incredibly useful for synthetic chemistry 'click chemistry' is frequently used in bioconjugation and can be used to attach fluorophores and other reporter molecules to biomolecules. Please examine a sample of our Alkynes.

Azides

We have recently expanded our catalogue to include a range of Azides. Azides are a structural feature used in drug discovery for its participation in the Huisgen azide-alkyne 1,3-dipolar cycloaddition reaction, an example of 'click chemistry', as well as being highly useful for synthetic chemistry 'click chemistry' is often used in bioconjugation and can be used to attach fluorophores and other reporter molecules to biomolecules. Other uses of Azides in synthetic chemistry can be seen in the production of amines and amine derived functional groups including ureas and urethanes via the Curtius rearrangement. Azides are also used in the production of iminophosphoranes via the Staudinger reaction, which can act as ligands for homogeneous catalysis. The use of azides in medicinal chemistry can be seen in the drug Zidovudine used as an antiretroviral for treatment of HIV/AIDS. Please examine a sample of our Azides.

Thinking of new compounds is one of the hardest challenges faced by researchers and it is of ever-increasing importance to find a source of inspiration. Explore our catalogue of more than 82,000 products with three new tools and get inspired!

The **SUBSTRUCTURE SEARCH** allows the inclusion of different isomers and enantiomers of the selected compound, its salt forms and other products which contain the same exact structure. The **SIMILARITY SEARCH** provides a broader list of compounds differing from the starting molecule for the functional groups, their position or for a modification in the skeleton. Finally we have developed our brand new and revolutionary **CLASS SEARCH** with our partners at ChemAxon. With this tool you are able to explore our entire catalogue by selecting the structures and functional groups you require in your compound allowing for the identification of the best starting material or perhaps a new synthetic approach for your project.

Great Molecules for Chemical Diversity
